Creating custom NAT network in windows container

In this blog, we will show you creating custom NAT network in windows container using docker commands.

INTRODUCTION

The windows container networks are similar to virtual networks like HYPER-V, VMWARE. The container will have its own network interface which is connected to a virtual switch. We can also create our own virtual networks, customize IP address space, and so on.

NAT NETWORKING OVERVIEW

- ◆ Go to PowerShell window and type the below command to get the network information.

Get-ContainerNetwork

```
PS C:\> Get-ContainerNetwork

Name Id Subnets Mode SourceMac DNSServer
---- --
nat e7d75de1-41bf-4fd9-a020-047d2c421ec5 {172.23.176.0/20} NAT

PS C:\> _
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-141.png>)

- ◆ This network (NAT) defined by **default** while building the container host on windows 2016 server. The subnet the network is **172.23.176.0/20**. As we spinning up the containers, the virtual NIC in this containers has been gone into containers have to use this network to reach the **internet**.

WINDOWS CONTAINER NETWORK TYPES

- ◆ There are **four** types of network types available for **docker networking**. Go to PowerShell window and type below view the help page of **new-containernetwork** cmdlet.

help new-containernetwork

```
PS C:\> help New-ContainerNetwork

NAME
    New-ContainerNetwork

SYNTAX
    New-ContainerNetwork [-Name] <string> [-SubnetPrefix <string[]>] [-GatewayAddress <string[]>]
    [-Mode {NAT | Transparent | L2Bridge | L2Tunnel}] [-SourceMac <string>] [-DNSServers
    <string[]>] [-DNSSuffix <string>] [-NetworkAdapterName <string>] [-WhatIf] [-Confirm]
    [<CommonParameters>]

ALIASES
    None

REMARKS
    Get-Help cannot find the Help files for this cmdlet on this computer. It is displaying only
    partial help.
    -- To download and install Help files for the module that includes this cmdlet, use
    Update-Help.
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-142.png>)

- ◆ The four network driver options are **NAT, Transparent, L2Bridge and L2Tunnel**.

NAT – We will get the NAT (Network Address Translation) network by default. The container in this network is in an **isolated network**. To reach the internet they need to use the IP address of windows container host.

Transparent – It's a little bit different to NAT. Each container in this network will get an IP address from the windows container host. It's similar to **bridged network**.

L2Bridge & L2Tunnel – These two network drivers are used for public and private cloud deployments. It's good for (Software Defined Network) network environments. Typically we will use L2 type networks in multiple container environments.

- ◆ Go to PowerShell window and type **ipconfig** command.

```
PS C:\> ipconfig

Windows IP Configuration

Ethernet adapter vEthernet (HNS Internal NIC):

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::f42f:cd0b:31f8:385a%2
    IPv4 Address. . . . . : 172.23.176.1
    Subnet Mask . . . . . : 255.255.240.0
    Default Gateway . . . . . : 

Ethernet adapter Ethernet:

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::5935:2eb3:2a13:bdc2%6
    IPv4 Address. . . . . : 192.168.232.80
    Subnet Mask . . . . . : 255.255.224.0
    Default Gateway . . . . . : 192.168.224.1

Tunnel adapter isatap.{5FE0388D-4979-4627-B195-2B58FFC31DA2}:

    Media State . . . . . : Media disconnected
    Connection-specific DNS Suffix  . : 

Tunnel adapter isatap.{101205F6-B8EF-4BFD-B46C-DCF433F33976}:

    Media State . . . . . : Media disconnected
    Connection-specific DNS Suffix  . : 
PS C:\> _
```

(<https://www.assistanz.com/>)

content/uploads/2017/04/image-143.png)

- ◆ You can see the virtual ethernet adapter that has an IP address as **172.23.176.1** and subnet mask as **255.255.240.0**

network has the IP address of 192.168.232.80 and subnet mask as 255.255.224.0.

- ♦ By default, the containers that we launch in this container host will go to 172 network.
- ♦ Launching a container using **docker run** command to check the default NAT networking.

docker run -it microsoft/nanoserver

```
PS C:\> docker run -it microsoft/nanoserver
```

 (https://www.assistanz.com/wp-

content/uploads/2017/04/image-144.png)

- ♦ Once the container is up and running, type **ipconfig** inside the container.

```
C:\>ipconfig

Windows IP Configuration

Ethernet adapter vEthernet (Container NIC 7167d2b6):

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::a186:1a2a:4955:b786%18
    IPv4 Address. . . . . : 172.23.178.150
    Subnet Mask . . . . . : 255.255.240.0
    Default Gateway . . . . . : 172.23.176.1

C:\>_
```

 (https://www.assist

content/uploads/2017/04/image-145.png)

- ♦ The IP address that has assigned to this container is **172.23.178.150**. Since NAT has been configured, we will able to access the internet.

```

C:\>ipconfig

Windows IP Configuration

Ethernet adapter vEthernet (Container NIC 7167d2b6):

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::a186:1a2a:4955:b786%18
    IPv4 Address. . . . . : 172.23.178.150
    Subnet Mask . . . . . : 255.255.240.0
    Default Gateway . . . . . : 172.23.176.1

C:\>ping google.com

Pinging google.com [216.58.197.78] with 32 bytes of data:
Reply from 216.58.197.78: bytes=32 time=21ms TTL=56
Reply from 216.58.197.78: bytes=32 time=19ms TTL=56
Reply from 216.58.197.78: bytes=32 time=21ms TTL=56
Reply from 216.58.197.78: bytes=32 time=18ms TTL=56

Ping statistics for 216.58.197.78:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 18ms, Maximum = 21ms, Average = 19ms

C:\>_

```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-146.png>)

content/uploads/2017/04/image-146.png)

CREATING CUSTOM NAT NETWORK

- ♦ As if we are using this address space **172.18** already, we can create our own **NAT** network for our environment. To docker service using below command.

stop-service docker

```

PS C:\> stop-service docker
PS C:\> _

```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-146.png>)

- ♦ Remove all the container network using the below command.

Get-ContainerNetwork | Remove-ContainerNetwork

Press A to confirm the deletion.

```
PS C:\> Get-ContainerNetwork | Remove-ContainerNetwork

Confirm
Remove-ContainerNetwork will remove the container network "".
[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y")
PS C:\> _
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-148.png>)

- ◆ To customize the address space for **NAT** network, we need to add the content in the **daemon.json** file. Use the **New-Item** command to create the **daemon.json** file under **C:\ProgramData\docker\config** folder.

New-Item -ItemType file -Path C:\ProgramData\docker\config -Name daemon.json

```
PS C:\> New-Item -ItemType file -Path C:\ProgramData\docker\config\ -Name daemon.json

Directory: C:\ProgramData\docker\config

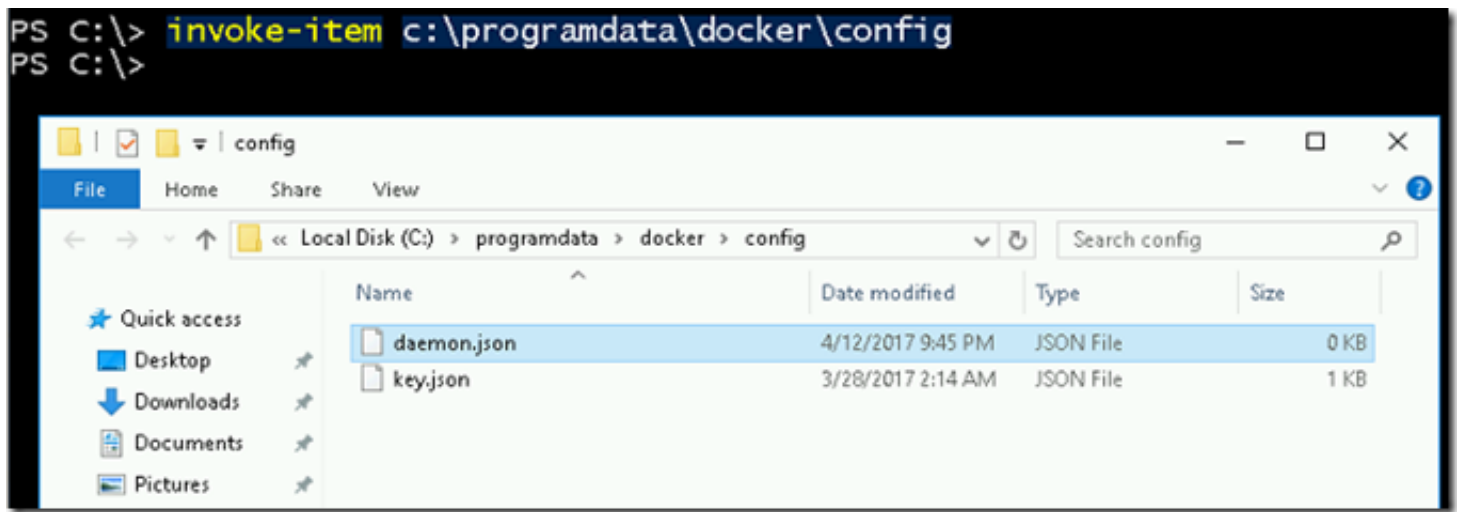

Mode                LastWriteTime         Length Name
----                -
-a----           4/12/2017   9:45 PM             0 daemon.json

PS C:\> _
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-149.png>)

- ◆ Navigate the **C:\ProgramData\docker\config** folder using **invoke-item** command.

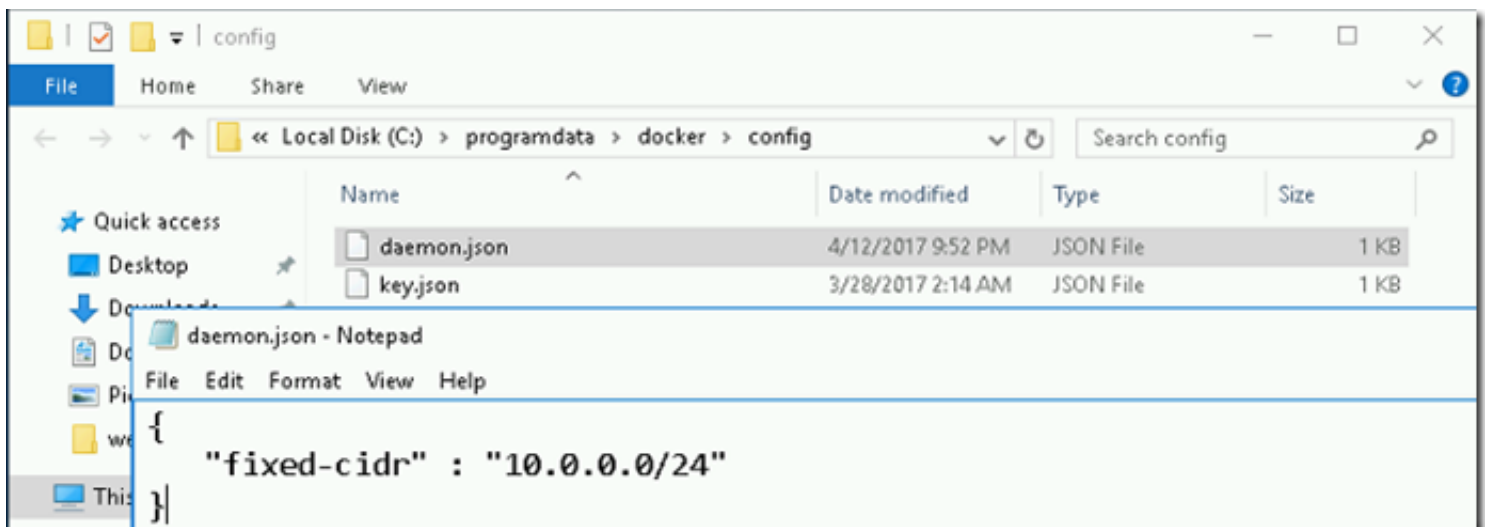

invoke-item c:\programdata\docker\config

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-150.png>)

- ◆ Add the below content in **daemon.json** file.

```
{  
  "fixed-cidr": "10.0.0.0/24"  
}
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-151.png>)

- ◆ Save the file and close it.
- ◆ Start the docker service using below command.

Start-Service docker

```
PS C:\> Start-Service docker
WARNING: Waiting for service 'docker (Docker)' to start...
PS C:\>
PS C:\>
PS C:\> get-service Docker

Status      Name          DisplayName
-----
Running     Docker        Docker

PS C:\> _
```

(<https://www.ass>

content/uploads/2017/04/image-152.png)

- ◆ Docker service is up and running fine. Check the NAT networking status using below command.

Get-ContainerNetwork

```
PS C:\> Get-ContainerNetwork

Name Id                               Subnets          Mode SourceMac DNSServers DNSSuffix
----
nat  640ecfc2-e770-4053-868e-5b831f9895d4 {10.0.0.0/24} NAT
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-153.png>)

- ◆ The subnet CIDR has been changed to **10.0.0.0/24** network. We have successfully modified network address space.
- ◆ Create a new container and make sure this new network works. Create a new container using the below command.

docker run -it microsoft/nanoserver

```
PS C:\> docker run -it microsoft/nanoserver _
```

(<https://www.assistanz.com/wp->

content/uploads/2017/04/image-154.png)

- ◆ Once the container is up and running type **ipconfig** to check the IP address information.

```
C:\>ipconfig

Windows IP Configuration

Ethernet adapter vEthernet (Container NIC 84836501):

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::dc62:40cb:4659:df2e%18
    IPv4 Address. . . . . : 10.0.0.25
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 10.0.0.1

C:\>_
```

(<https://www.assistanz.com/wp-content/uploads/2017/04/image-155.png>)

- ◆ Also, we are able to ping the internet domain without any problem.

```
C:\>ipconfig

Windows IP Configuration

Ethernet adapter vEthernet (Container NIC 84836501):

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::dc62:40cb:4659:df2e%18
    IPv4 Address. . . . . : 10.0.0.25
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 10.0.0.1

C:\>ping google.com

Pinging google.com [216.58.220.46] with 32 bytes of data:
Reply from 216.58.220.46: bytes=32 time=168ms TTL=56
Reply from 216.58.220.46: bytes=32 time=264ms TTL=56
Reply from 216.58.220.46: bytes=32 time=724ms TTL=56
Reply from 216.58.220.46: bytes=32 time=814ms TTL=56

Ping statistics for 216.58.220.46:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 168ms, Maximum = 814ms, Average = 492ms
